

--ABSTRACT OF THE DISCLOSURE

The invention relates to a nozzle blowing case of a tenter frame for treating a textile web of fabric by blowing it with a treatment agent stream either from hole-type nozzles or from a slotted nozzle extending transversal to the direction of conveyance of the web of fabric. In order to simplify the switching of the treatment agent stream from the hole-type nozzles to the slotted nozzles (and reversed), a moving slide is assigned to the blow-out surface of the blowing case that, in one position, closes the slotted nozzle and, in another position, closes the hole-type nozzles.--
